Recommendation Letter for Stephane Gonzales

Stephane Gonzalez was working for Airbus DS GmbH in Friedrichshafen in the Satellite on-board Mass Memory Software Development Team as an external contractor for the period from 18/04/2016 to 31/08/2017

His main tasks during this period were:

- Reception and data pack review of the “Data Handling System” library and integration on EUCLID, NISAR and NGMMA projects.
- Involvement in design of a complex real-time software, including UML modelization and contribution to the User Manual.
- Supporting team members for SW-SW integration.
- Implementation, integration tests and debug on the hardware test bench of PUS services and the underlying components.
- Implementation of a co-design tool allowing to generate flight software code from the TMTC-ICD.

Stephane quickly became involved in the topic to develop software functions for the mass memory equipment . After a short time he was able to work on his task independently, quickly and conscientiously. He was always very motivated and eager with his task. The quality of the work was always far above the requirements. The work transferred to Stephane he always took to our full satisfaction.

I would like to thank Stephane for the very positive and gratifying cooperation and wish him all the best and very much success for his further professional career.
